

Can an optical power meter measure normal light

Overview

A traditional optical power meter responds to a broad spectrum of light, however, the calibration is wavelength dependent. The term usually refers to a device used for measuring the average power in fiber optic systems. Other general purpose light power measuring devices are usually called radiometers, photometers, laser power. An optical power meter (OPM) measures the power levels of light signals in devices that transmit data or power using light. It details the main components, including sensor heads and display units, and explains the two primary sensor technologies: robust thermal sensors for high powers and. These meters provide a precise and reliable method for quantifying the power level of light across various wavelengths, making them essential instruments in the testing and calibration of optical systems.
