

## How many network cables can a telecom server chassis connect to

### Overview

When cabling an individual chassis, connect one network cable from each management module to the data center top of rack switch. Ensure that both ports on the top of rack switch are enabled and on the same network and VLAN. The MX7000 chassis features dual redundant management modules, with each management module featuring two management network ports, for a total of 4 management network ports on the chassis. The management network is meant to provide network connections for chassis management separate from the. To help with cable management, allow additional space in the rack above and below the chassis to make it easier to route copper cables (plus up to eight copper cables per Cisco UCS 5108 server chassis) through the rack. Network racks are typically 19" wide and not as deep as server racks. Outages, downed systems, data transmission errors — even overheating or fires can occur with power cables. This section covers topics listed in the following table.
