

## Is a larger optical module always better

### Overview

800G optical modules provide 2× bandwidth and ~30–40% better power efficiency per bit than 400G, while reducing fiber count significantly. However, 400G remains more cost-effective for enterprise workloads, and 1.6T is still in early deployment stages primarily targeting 400G, 800G, and 1.6T. Average Optical Power Average optical power refers to the optical power outputted by the optical module's transmitter under normal working conditions, which can be understood as the intensity of light. They convert electrical signals (from your router/switch) into light pulses (for fiber cables) and vice versa. The stronger the. The optical module is a core component in optical fiber communication systems, and its performance parameters directly impact the transmission rate, stability, and reliability of the entire system. As AI model training and inference scale to thousands of GPUs, traditional network architectures are being pushed to their limits.
