

Is the optical module located

Overview

The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. As an important part of fiber-optic communication, an optical module is a photoelectric converter which converts electrical signals into optical signals and vice versa. Operating at the physical layer of the OSI model, optical modules are core devices in optical. Optical modules are devices used to connect network devices, transmit and receive data between network devices, and can be used to convert optical and electrical signals.
