

Methods for dividing network segments using aggregation switches

Overview

Network segmentation with switches involves dividing a network into smaller, isolated segments to enhance security, improve performance, and simplify management. Learn how to configure a switch for network segmentation effectively by using VLANs, subnetting, and access control. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. It enhances security by limiting unauthorized access and containing potential threats within defined boundaries. This arrangement increases throughput beyond what a single relationship could sustain, offers redundancy in case one of the links. This document provides campus networks typical configuration examples and feature typical configuration examples. In this example, we have a common.
