

Network patch panel module principle

Overview

The key principle is the separation between permanent and flexible cabling. A patch panel, including fiber patch panels and Ethernet patch panels, is a passive network device that centralizes, terminates, and organizes multiple copper or fiber cables. Serving as the interface between permanent cabling and active equipment, it provides clearly labeled ports that make. A patch panel is one of those components that is easy to overlook when planning a network — it does not switch, route, or process data, and to the uninitiated it can look like an expensive way to add an extra set of connectors between the cable and the switch.
