

Relay protection current direction

Overview

Directional relays are protective devices that isolate faults in power systems by detecting the direction of fault currents. This White Paper describes the sense, the potentials and the use of directional protection and directional zone selectivity functions, hereafter called “D” and “SdZ D” respectively. The PR123/P and the PR333/P units carry out excludable directional protection (“D”) against short-circuit with. The aim of this technical article is to cover the most important principles of four fundamental relay protections: overcurrent, directional overcurrent, distance and differential for transmission lines, power transformers and busbars. That single capability is decisive in parallel feeders, ring networks, and multi-infeed grids, where faults may be fed from both sides.
