

Secondary distribution boxes are configured along the route

Overview

The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. A feeder usually begins with a feeder breaker at the distribution substation. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. The following electrical ratings are typical: As a result of locating power transformers and their close-coupled. Secondary distribution network includes medium voltage/low voltage (MV/LV) step-down transformers and LV lines, for example, 230 and 400 V, which deliver the power generated to LV commercial and residential consumers. The UK's power system structure is shown in Fig. ABB's portfolio of smart control cabinets offers a convenient and cost-effective solution et today's diverse and evolving customer requirements within power distribution.
