

What are the protection measures for 10kV main busbars and busbars

Overview

Common methods of protecting busbars include overcurrent-based interlocking schemes, overcurrent-based differential protection, high-impedance differential protection, and percentage differential protection. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. The high magnitude fault currents require high-speed operation of the busbar protection to limit equipment damage. Current Differential Protection: This protection method connects CT secondaries in parallel and. Thus protection of busbars requires special consideration bearing in mind that the loss of a busbar following a busbar fault can result in subsequent loss of lines and transformers connected to the busbar. Advantages of Breaker and a half arrangement: It has 3.
