

What is a multimode fiber optic transceiver used for

Overview

Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections . Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections . Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s. Each module type uses LC interfaces, and professionals commonly group them together under the name LC SFP modules. They mainly differ in the type of optical fiber they operate. In contrast, multimode fiber uses a much larger core, commonly 50 or 62.5 micrometers, allowing many spatial modes to propagate simultaneously.
